

## One Card - One Identity

*Are you a DoD employee or military service member exasperated with carrying and keeping track of multiple identification cards in addition to your DoD CAC?*

Cogent, Inc. possesses the vision combined with the development and integration expertise to support the DoD in achieving its objective of establishing the Common Access Card (CAC) as the single “One Card” identification card to provide controlled access to all physical, logical, entitlement, and related systems and programs. Through 15 years of smart card application development and systems integration, we possess extensive knowledge and a progressive track record in planning, developing, assessing, and implementing CAC-centric solutions.

We are technically proficient in the myriad of technologies incorporated within the CAC, including biometrics, contact and contactless smart cards, public key infrastructure (PKI), secure card manufacture, and legacy barcodes. We are capable of demonstrating proven past performance in successfully integrating the CAC and its technologies into web-based and web-enabled applications, mobile devices, and other hardware devices.

Cogent Security Solutions applies implementation strategies and methodologies that remove redundant identity proofing processes and ID tokens. The streamlined effect on operations that results facilitates substantial long-term cost savings and efficiencies for DoD agencies. We are adept at integrating solutions that utilize the CAC as the single “One Card” identification for all types of access control applications.

**Maximizing CAC Convenience**

## One Card - One Identity Maximizing CAC Convenience

In addition to eliminating functionally duplicative legacy systems and enhancing existing systems, our creation of a unified identity assurance process for enterprise-wide use will significantly and reliably:

- Promote cost savings by streamlining paper-based processes, thus reducing wait times, lost documentation, and various other costly errors;
- Provide a more secure authentication system to protect facilities and systems through the use of CAC security technologies, such as PKI, digital fingerprints, digital photo, PIN, and data elements;
- Address system-to-system bridging requirements to enable efficient workflow and data sharing, while closing gaps created by disparate systems; and
- Promote improvements in quality of life by eliminating the need for issuing multiple ID cards for different purposes, and decreasing processing time that ensues from errors (e.g. data entry mistakes, lost paperwork, etc.)

Cogent Security Solutions works to reduce overhead and administrative support structures, while simultaneously improving the efficiency and effectiveness of support for our DoD clients. In order to free up resources to focus on mission-critical activities, we follow four guiding principles:

- Re-engineer: Enhance modern business practices to achieve world-class standards of performance
- Consolidate: Streamline organizational practices to remove redundancy and maximize synergy
- Analyze: Apply current, readily available technologies to improve quality, reduce costs, and respond to customer needs
- Eliminate: Reduce excess support structures to increase effectiveness and focus on core competencies.

To learn more about how our solutions can make the CAC the “One Card” that replaces all other cards used for identification, access, and eligibility, please contact:
